```

Disclosure; Fig 1A-C; 37pp; English.

This DNA sequence encodes serine protease SP1 (YuxL) of Bacillus subtilis. Novel serine proteases SP1, SP2, SP3, SP4 and SP5 (see AAW97789-93) were identified via a RASTA search of Bacillus subtilis genomic nucleic acid sequences. SP1 was identified by its structural homology to the S9 type serine protease dap2 of yeast. SP2, SP3, SP4 and SP5 were identified by their structural and overall amino acid homology to SP1. Host cells in which the naturally occurring gene encoding one or more of SP1, SP2, SP3, SP3, SP4 and SP5 water identified by their structural and overall amino acid homology to SP1. GP2, SP2, SP3, SP3, SP3, SP4 or SP5 is mutated such that the proteolytic activity is diminished or deleted altogether, can be used for the production of heterologous proteins, e.g. a hormone, enzyme, growth factor, cytokine, protease, carbohydrase, lipase, racemase, epimerase, tautomerase, mutase, transferase, kinase or phosphatase (claimed). SP1, SP2, SP3, SP4 and SP5 can also be produced on a large scale of a manner of spine scale of the a microbial host expression system for use in cleaning scale. compositions such as detergents, bar or liquid soap, dish-care formulations and contact lens cleaning solutions, or for peptide hydrolysis, waste treatment, textile applications, as fusion-cleavage enzymes in protein production, and as animal feed

The present sequence represents a Pyrococcus horikoshi acylpeptide hydrolase encoding DNA sequence. The enzyme has the following properties: (a) it hydrolyses an acylpeptide; (b) an optimum temperature of 90-95 degrees Centigrade; (c) an optimum pH of 5.0-6.0; (d) no loss of activity when heated to 95 degrees Centigrade for 3 hours at pH 7.5; and (e) a molecular weight of 60 kDa. The enzyme is claimed useful for hydrolysing the amino end of an acylated protein and a peptide at
                                                                                                                                  ttaaaatacgcagcaaacgtggagacaccgcttttgatactgcatggcgagcgggatgac 1800

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid encoding heat-stable amidase from Thermococcus GU5L5 - useful for removing N-terminal amino acids from synthetic peptide(s) \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This novel isolated nucleic acid encodes a 622 amino acid thermostable amidase (see AMW1148) of the archaebacterium Thermoscous GUSLS. It was isolated from a genomic library of GUSLS by screening for amidase activity, and subjecting DNA from a positive clone to PCR amplification (see AAV12888-89). The nucleic acid can be used in the production of amidase in host cells, and to identify related sequences encoding similar enzymes. The encoded amidase is used to remove Arg, Phe or Met from the N-terminus of synthetic peptides or peptidomimetics (claimed). Removal of the N-terminal residue can be done even in the presence of a more reactive ester bond (very difficult to achieve non-enzymatically). The amidase is selective for L-amino acids and can therefore be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        used to produce optically active compounds. The protein tolerates temperatures up to at least 70 degc and high concentrations of organic solvent (e.g. over 40% dimethyl sulphoxide) so can cleave
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gagtttcaggtgctggcggcgaaaggatacgcggtcgtttatatcaatccgagaggaagc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       gacgatgtgatgcaggctgtggatgaggctatcaaacgagatccgcatattgatcctaag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     gaggacataatgaacggcatcgaggagttcttcaagctcgaaccgcaggccgacagggag

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTs are used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of genes same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production potential of the microorganisms to be improved. New genes may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monitoring differential expression of genes in filamentous fungal cells uses fluorescence-labeled nucleic acids isolated from the cells and a

```
discovered, possible functions of unknown open reading frames can be identified and gene copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway engineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results. AAF07478 to AAF11247 represents ESTs from Fusarium veneratum; AAF11248 to AAF11853 represents ESTs from Fusarium veneratum; AAF11248 to AAF11853 represents ESTS from Appergallus
                                                                                                                                                                                                               niger; AAF11854 to AAF14878 represents ESTs from Aspergillus oryzae; and AAF14879 to AAF15337 represents ESTs from Trichoderma reesel, which are all specifically claimed in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                         1358 aggtgctggcggaaaggatacgcggtcgtttatatcaatccgagaggaagccacggct 1417

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a composition comprising two nucleic acids each containing an electron transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on Nucleic acids containing electron-transfer single surface

AAF58252,

Example 6; Page 127; 159pp; English.

HHHX0XCCCCXX

õ n ô 금 ô H 8 ㅁ SV. 끔

The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
